AutoCAD 2018 Some of the more notable products based on AutoCAD include Autodesk 3ds Max (formerly 3ds Max Design), Autodesk Maya (formerly Maya), Autodesk Smoke (formerly Smoke), Autodesk Fusion 360, Autodesk Alias, Autodesk Parametric 3D, and Autodesk Revit. History Autodesk's original AutoCAD software was first developed in 1979 by Larry Tesler and Ben Fry at the newly founded AutoDesk corporation. At that time, Autodesk was known as the Computer-Aided Design Group of the advertising agency, The Fry Agency. Tesler and Fry were tasked with designing a new type of CAD for industrial use. The first release of AutoCAD was in December 1982, for the Apple II and IBM PC compatibles, with CAD models and geometry primitives (vertices, faces, etc.) and objects (edges, circles, lines, etc.). The release also included a separate drawing component for editing curves and splines, a feature that was absent in competing CAD programs such as MicroStation and Solid Edge. Steve Jobs AutoDesk CEO Steve Jobs took an interest in AutoCAD and the development team. Jobs is said to have been impressed by the ease of the interface when compared to Xerox's PARC technologies. The software helped Autodesk gain a large share of the CAD market (at the expense of other programs). In 1994, AutoDesk signed a deal with Apple, allowing the company to develop Mac OS X for OS 9 and be the first CAD vendor to offer native support for the operating system. In the mid 1990s, Autodesk's products were already the primary CAD solutions on the Macintosh platform, along with MacDraw. 1997: New Release A major update of AutoCAD, AutoCAD 1997, was introduced in 1997, adding several new features and improvements. These features included the ability to import and export DXF and DWG files, a new ortho mode, subselection highlighting, and an improved drawing application interface (DUI). Other notable changes included a multiselection box, brush output, and an option to create a plotter-ready file. AutoCAD 1997 also included the ability to work with project files, including geometry coherency and reference to other objects. The Ortho project window allowed users to drag objects into different views and see how they would fit. The

However, few studies have investigated the effect of preoperative neck flexion on final neurologic status or other clinical outcomes after ACDF surgery. Our study found that a higher degree of neck flexion was associated with significantly decreased pain intensity and improved functional status before and after the operation. This indicates that neck flexion may have a protective effect on

cervical myelopathy. However, the spinal cord is a very vulnerable structure, and a number of studies have shown that preoperative neck flexion had no impact on the final clinical outcomes after cervical fusion surgery. We hypothesize that the cervical spine is a complex structure in which many factors and variables (such as muscle strength, muscle tone, reflex threshold, proprioception, or spino-pelvic balance) must be considered. For example, Thompson et al.[@B15] observed that preoperative neck flexion had no impact on the functional recovery after cervical fusion. Others have reported similar results. However, in the absence of a comprehensive study, one cannot conclude that the reason for the protective effect of neck flexion is related to a biomechanical change. The protection may also be related to the potential effect of neck flexion on venous drainage from the thoracic cavity. A recent study by Breuer et al.[@B16] showed that the degree of neck flexion is associated with lower pulmonary venous pressure and lower pulmonary vascular resistance. Although we do not know the reasons, we hypothesize that cervical flexion may have a protective effect on the lungs because the transverse thor a1d647c40b
