Nabataea michikoe *Nabataea michikoe* is a species of leguminous tree native to the West Indies and South America. Common names include *pate* (from French), American chestnut, and Spanish chestnut. History It was originally discovered by Alexander von Humboldt in 1816, during his trip across the Isthmus of Panama. It is commonly known as the Spanish chestnut. It has long been considered a native species of the Americas. The species was named by Carlos L.

Pavón in 1845. The "Spanish chestnut" is popular among landscape plants for its lovely appearance in shady places, but it is susceptible to a range of fungal and bacterial diseases.

In 1784, John Bartram documented that the tree was a popular choice of shade trees in North America, but it was thought to be extinct by 1890.

Several attempts have been made to bring this tree back from the brink of extinction, most notably at Ohio State

University's Columbus Zoo, where specimens have been reproduced in a

nursery since 1986. The trees are
