Ã .[Fluorine-18-fluorodeoxyglucose positron emission tomography: a new technique in the diagnosis of recurrent breast cancer]. Fluorine-18-fluorodeoxyglucose positron emission tomography (18F-FDG PET) for the diagnosis of recurrent breast cancer is useful, although its sensitivity is not high. In this study, we investigated the correlation between the accuracy of the diagnosis by 18F-FDG PET and the degree of its accumulation in the recurrent lesions. We examined 40 patients with breast cancer recurrence using 18F-FDG PET. Initial treatment and recurrence were treated surgically in all patients. All patients underwent a series of imaging examinations to detect recurrences. Accumulation of 18F-FDG was assessed using the maximal standardized uptake value (SUVmax). Among 40 patients, 18F-FDG PET images could not be interpreted for 4 patients with recurrence. The remaining 36 patients were assessed for recurrence. 18F-FDG PET correctly identified recurrent lesions in 21 of 27 patients (77%), including 2 of 4 patients (50%) without abnormality on other examinations. Our results indicated that 18F-FDG PET had a high sensitivity for the detection of early recurrences and that the degree of its accumulation had no relationship to the diagnosis of recurrence. Because both surgical treatment and radiotherapy can be performed easily after a positive diagnosis by 18F-FDG PET, 18F-FDG PET is useful for the diagnosis of recurrent breast cancer.package image // import "github.com/docker/docker/image" // DigesterReference is an interface that different link builders will use // to access Digesters that have been registered with the image service // to compute a canonical name and version from an image Id 0cc13bf012

A: The way you declared it in main() is simply wrong. Notice this line: currPage = new ArrayList(); This means the array list will hold references to Page objects, not instances of Page. This should instead be: currPage = new ArrayList(); currPage.add(new Page()); Don't forget to add a constructor that takes an Page object. This would probably also prevent you from converting the array to a List in the first place, as your array will already contain a reference to a Page object (and a reference in no way means an assignment). Results of aortic and mitral balloon valvuloplasty in high-risk primary patients: the Nordic Registry. The aim of this study was to document experience from a single centre, comparing efficacy, safety and risk factors of aortic (AVB) and mitral (MVB) balloon valvuloplasty (BV). Thirty-three procedures were performed in 25 patients (4 with bicuspid AV and 16 with mitral stenosis) between 1996 and 2000. BV was successful in 66% of cases and complications occurred in 45% (mostly intra-procedural). After a median follow-up of 6 months and 4.5 years, respectively, freedom from redo BV/surgical treatment was 24%/0% in AVB and 72%/0% in MVB. An increased pre-procedural Qp:Qs was associated with a reduced event-free survival, in contrast to increased peak gradient. Pre-procedural Qp:Qs > or =1.5 was related to an increased event-free survival in AVB. A smaller baseline area was associated with an increased risk of the outcome event. Event-free survival in AVB was significantly lower in patients after mitral or aortic BV. In high-risk primary patients, AVB has a higher morbidity and mortality than MVB, despite the procedure being technically more demanding. A pre-procedural mean gradient of at least 20 mmHg and an area of Cerebral palsy (CP), a nonprogressive disorder of movement and posture occurring in infants, usually results from damage to the immature brain that occurs during gestation or birth, or both. While much research has focused on
